

INFO6007 Week 13 Tutorial Revision Activities

This document contains tutorial revision sets designed for Week 13. The activities are aligned with the INFO6007 exam style and include MCQ quizzes, scenario-based practice questions, and tutor marking discussion activities.

Week 13 Tutorial Set – Leadership, Governance & ITSM Revision

Part 1 – Quick Quiz Battle (MCQ Practice)

Q1. Which leadership style gives team members the greatest autonomy?

- a) Transformational
- ☒ b) Autocratic
- ☒ c) Laissez-faire
- d) Transactional

Q2. Which ITIL concept focuses on delivering value through services?

- ☒ a) Service Value System
- b) Risk Matrix
- c) Project Charter
- d) WBS

Q3. Governance in IT projects mainly focuses on:

- a) Coding quality
- b) Team motivation
- ☒ c) Oversight and accountability
- d) Vendor recruitment

Q4. Which communication issue is most likely to reduce team morale?

- a) Regular feedback
- ☒ b) Unclear expectations
- c) Daily standups
- d) Recognition programs

Q5. Which quality perspective focuses on whether the system effectively serves user needs?

- ☒ a) Conformance to requirements
- ☒ b) Fitness for use
- c) Technical compliance
- d) Benchmarking

Part 2 – Scenario-Based Practice Questions

Leadership & Team Management

A software development team is experiencing tension between senior engineers and junior developers. Senior staff feel overloaded, while junior members feel unsupported.

Question:

Explain ONE leadership strategy that could improve both productivity and team morale.

Governance

A fintech company is developing a mobile banking application. A steering committee monitors compliance, approves budgets, and ensures alignment with company policies.

Question:

Explain why governance is important in highly regulated IT projects.

ITSM Value Creation

A university launches a new student portal that is technically functional, but students complain that it is slow and difficult to use.

Question:

Using ITSM concepts, explain why the service may still be considered low quality.

Communication Management

A project team working remotely across multiple countries experiences delays because important updates are not being shared consistently.

Question:

Explain how improved communication structures could positively impact project performance.

Tutor Marking Secrets – Weak vs Average vs HD Answers

Leadership vs Governance

Scenario:

A fintech company is developing a mobile banking application. Explain the difference between project leadership and governance.

Weak Answer:

Leadership manages people while governance manages rules. Both are important because projects need management and control.

Why weak?

- Too generic
- No scenario references
- Minimal explanation

Average Answer:

Project leadership focuses on motivating and guiding the project team, while governance focuses on oversight and compliance. Leadership improves team performance, while governance ensures alignment with organisational goals.

HD-style Answer:

Project leadership and governance serve different but complementary roles in IT projects. Leadership focuses on motivating and influencing people to achieve project objectives, while governance focuses on oversight, accountability, compliance, and strategic alignment. In this scenario, leadership helps the team collaborate effectively during development, while governance ensures the banking application complies with organisational policies and regulatory requirements. Both are essential because leadership improves execution while governance ensures control and business alignment.

Risk Response

Scenario:

A healthcare IT project identifies cybersecurity attacks as a major project risk. Recommend ONE suitable response strategy.

Weak Answer:

The team should manage the risk carefully because cyberattacks are dangerous.

Why weak?

- No PM terminology

- No strategy identified
- Too vague

Average Answer:

A suitable response strategy is mitigation. The team can reduce the likelihood of cyberattacks by using encryption and security testing.

HD-style Answer:

A suitable risk response strategy is mitigation. Risk mitigation attempts to reduce either the probability or impact of a risk before it occurs. Since the project involves sensitive healthcare data, cybersecurity threats represent a high-impact risk. The team can implement controls such as encryption, penetration testing, access management, and security monitoring to reduce both the likelihood and impact of breaches. This proactive approach is essential in healthcare IT projects due to privacy and compliance requirements.

Procurement Justification

Scenario:

A company outsources software testing to an external vendor. Discuss ONE advantage and ONE disadvantage.

Weak Answer:

Outsourcing is cheaper but risky.

Why weak?

- Very short
- No explanation
- No project management concepts

Average Answer:

One advantage of outsourcing is access to specialised expertise. One disadvantage is reduced control over project deliverables and timelines.

HD-style Answer:

One major advantage of outsourcing software is access to specialised expertise and advanced testing capabilities that may not exist internally. This can improve quality and reduce recruitment costs. However, outsourcing also creates risks such as reduced visibility into project activities, communication issues, and dependency on the vendor. Effective procurement management and vendor monitoring are therefore essential to minimise project risks.

ITSM Value Creation

Scenario:

A university launches a student portal that technically works, but students complain that it is slow and difficult to use.

Weak Answer:

The system is bad because students do not like it.

Why weak?

- Informal language
- No ITSM terminology
- No explanation

Average Answer:

The service may still be considered low quality because ITSM focuses on customer satisfaction and value delivery, not just technical functionality.

HD-style Answer:

According to ITSM principles, services create value when they enable users to achieve desired outcomes effectively. Although the student portal is technically functional, poor usability and slow performance negatively affect customer satisfaction and user experience. From an ITSM perspective, service quality depends not only on technical operation but also on whether the service is fit for use and delivers meaningful value to customers.
